The work of LEVER Architecture explores making, materiality, and experience using an economy of design. Thomas is a world and domestic leader in mass timber design and construction, employing the technology on the projects produced regionally by the office. LEVER challenges conventional methods of fabrication, uses local and commonplace materials in unexpected ways, and pursues construction that benefits the environment and regional economy. This approach emphasizes transformation at every level of design and brings greater beauty and meaning to the final built work.

Thomas Robinson is the Founder and Principal of LEVER Architecture. He works closely with clients to develop the design vision for each project. Prior to establishing the firm, Thomas led cultural and institutional projects for Allied Works and Herzog & de Meuron. He received an MArch from the Harvard University Graduate School of Design and a BA from the University of California, Berkeley.
